

Ques 1

Analyze a provided dataset of sales transactions and generate a report highlighting the highest-selling products.

Sample Dataset:

Product ID, Sales Amount

P001, 150

P002, 200

P003, 120

Ques 2

Create a base class Shape with a method to calculate area. Define derived classes Circle and Rectangle that inherit from Shape and calculate their respective areas.

Example Input: circle = Circle(5), rectangle = Rectangle(4, 6)

Expected Output: Circle Area: 78.54, Rectangle Area: 24.

Ques 3

Create visualizations (bar chart, pie chart) for a dataset representing the distribution of different product categories.

Sample Dataset:

Category, Count

Electronics, 25

Clothing, 35

Food, 40

Ques 4

Define a class Animal with a method speak. Create instances of classes Dog and Cat that inherit from Animal and override the speak method to produce respective sounds.

Example Input: dog = Dog(), cat = Cat()

Expected Output: Dog says: Woof, Cat says: Meow.

Ques 5

Develop a program that reads a list of student names and generates a random order for conducting presentations.

Sample List: ["Alice", "Bob", "Eve", "David"]

Ques 6

Find common elements between two lists.

list1 = [1, 2, 3, 4, 5], list2 = [3, 4, 5, 6, 7]

Ques 7

Find common keys between two dictionaries.

dict1 = {"A": 1, "B": 2, "C": 3}, dict2 = {"B": 4, "C": 5, "D": 6}
